

Preference Management

Eric Holtzclaw and Eric Tejada

INTRODUCTION

To remain competitive, businesses must continually look for better ways to engage with customers and prospects. Now that we're in the digital age and the era of Big Data, the opportunities grow exponentially for better customer engagement – as do the odds that a business crosses the line between relevant communications and being unsettling or invasive.

Consumers want to be in control of the conversation with a business. Unsolicited offers sent by mail, email, text message or phone might be welcome. Or, they could be viewed as not relevant or communicated via a channel that is deemed as disruptive. For instance, a consumer might want to hear about offers for carpet cleaning, but a text message that they essentially must pay for might be considered unwelcome. The same goes for a phone call that interrupts dinner.

Instead of putting the consumer in control of the conversation, the business is dictating how they will communicate. Businesses that go this route face the risk of opt-outs and unsubscribes. Instead of enhancing customer engagement, they find closed communication channels and the inability to market to these consumers.

ENABLING THE CUSTOMER

That's where preference management comes into play. Technology has enabled organizations to predict a consumer's behavior by collecting data on previous purchases or what consumers have viewed on a website. However, unless a company specifically asks for a consumer's particular product or service interests or their desired form of communication, they're not enabling the consumer to control the conversation, the communication method and the frequency of engagement.

Preference management is the term used to describe the active collection, maintenance and distribution of unique consumer characteristics, including product or service interest, desired communication channel and even the frequency of communication.

Combined with Big Data, the use of preference management gives organizations a powerful technology tool to further enhance and boost customer engagement. That's because the preferences are not derived from profile data or purchase history or what page they viewed on a website, but were expressly stated by the consumers themselves.

ENTERPRISE PREFERENCE MANAGEMENT

Enterprise Preference Management (EPM) goes beyond simple permission-based marketing. It's also more than a preference center, which allows customers to manage the data you maintain on them. Preference centers for single channels such as email can be deployed quickly and inexpensively. For small companies that use one communication channel, and if all departments share that channel, a single preference center is adequate.

The operative word in Enterprise Preference Management is "enterprise." An enterprise has the following characteristics:

- Multiple business units, brands and/or products or services
- Multiple communication channels, including email, call centers, social media, text messages and mobile devices
- Multiple departments (marketing, sales, customer service, support, etc.) within the organization that communicate with customers and prospects
- Multiple databases throughout the organization, including marketing databases, marketing automation systems, CRMs and third-party vendor databases such as those of an email service provider.

An Enterprise Preference Management solution provides the ability to: 1) Capture and maintain opt-ins via all customer touchpoints (web, mobile, social, email, etc.) for multiple campaigns and communications channels; 2) Capture the desired frequency of communications; 3) Centralize all customer and prospect preferences in one repository; and 4) Leverage API tools to status all databases across the enterprise with current opt-in preferences.

Unlike a preference center, Enterprise Preference Management incorporates the ability to obtain and maintain customer permissions and preferences across the whole organization. Its ability to track, archive and report on privacy preferences also satisfies any and all state, federal and industry requirements.

THE IMPORTANCE OF EPM

There is mounting evidence that the moment has arrived for Enterprise Preference Management. A recent Oracle survey¹ of more than 1,300 senior executives found that 97% agree that customer experience is critical to success, while 93% have made it one of their top three priorities for the next two years.

That's not surprising. According to Forrester Research,² consumers that engage via multiple channels spend two to three times more than average consumers. So the Customer Lifetime Value (CLV) for delivering on customer preferences is significant.

Still, the Oracle study points out that fewer than 40% of respondents have customer experience initiatives in progress, and only 20% of those that do would describe them as sophisticated.

Forrester's *Interactive Marketing Predictions* study says that by the end of 2013 nearly half of online adults globally will be always addressable. This is fueled by the increased adoption and utility of tablets, smart phones and other devices. These customers demand personalized, relevant attention that is designed around their needs and wants, rather than around your marketing channels.

If you don't change the way you think about engaging these customers, you'll quickly lose relevance.

RULES AND REGS

Numerous regulations govern opt-outs or privacy, including Do Not Call laws, the CAN-SPAM Act and the Junk Fax Act. The latest change to the Telephone Consumer Protection Act (TCPA) requires prior express written consent (or opt-in) for soliciting consumers via an automated telephone dialing system (ATDS) for voice, text or recording on their mobile phones, effective October 16, 2013.

Canada and the European Union also have laws that require companies to obtain opt-ins before marketing to consumers. The regulatory environment continues to become more restrictive, not less.

MAKE IT RELEVANT

Consumer and customer preferences are relevant to organizations of all sizes (B2B and B2C) that want to remain relevant and engage their customers. However, small companies typically use preferences on a single channel such as email.

EPM that spans divisions, departments, brands and channels tends to be more relevant to large companies today. Early adopters include *Fortune* 1000 companies, but many mid-size companies can leverage preferences as well.

Compliance with multiple federal, state and international regulations makes EPM relevant to a wide range of organizations. Marketers face the tedious task of complying with a myriad of state and federal "do not contact" laws. Compliance is not an either/or proposition; companies that ignore these laws face the risk of significant fines, undesirable publicity and loss of consumer trust.

So in addition to building a technology infrastructure for preference management and gaining stakeholder buy-in, marketers must also have the ability to collect, manage and archive privacy choices for state, federal and industry regulations.

2 - Unified Communication Industry Study, Forrester Research, February 2006

Additionally, regulatory compliance is an ongoing effort. Regulatory requirements change, so it's essential to have an infrastructure and processes in place to stay current. Beyond compliance, organizations profit from EPM through the increased engagement of customers and prospects, who feel more in control of the relationship and the content they receive. As such, they are more likely to read the content and less likely to opt out. This also results in less marketing waste by not sending communications to customers that don't want them.

Ultimately, better customer engagement leads to increased CLV, as well as loyalty and "share-of-wallet."

BEST PRACTICES

A key to driving authentic customer engagement is letting customers share ownership of the conversation based on their interests and preferences. This isn't a new idea, but to achieve it requires brands expand their collection of consumer preferences throughout all organizational customer touchpoints such as websites, call centers, email campaigns, mobile devices and social media. In doing so, the following best practices (and the impact they have on development) should be considered:

- Preference centers should be optimized to collect just the right amount of data. For example, "customer typing" should be leveraged to present only the relevant options to a customer (e.g., don't offer Canadian customers services that are only available in the U.S.).
- Don't overwhelm consumers with too many questions, or they will abandon the process. Rather, ask questions that are pertinent to what they're doing at the time. Then progressively add to that information over time.
- Optimize the preference centers for the platform through which you'll be collecting the preferences. For example, preference centers for mobile devices should be developed specifically for mobile devices and should only ask a few questions.

SILOED DATA & TECHNOLOGY

Legacy systems and fragmented customer data remain key obstacles to advanced customer experience initiatives. In order to truly impact the customer experience, EPM must span all departments, business units, brands and third-party vendors.

The EPM system must integrate with marketing databases, CRM systems and third-party vendors in order to empower organizations with preference data that can be used to improve campaign results, increase sales revenue and improve customer loyalty, with the added bonus of satisfying ever increasing privacy requirements.

When organizations can't effectively share or collectively interpret full-spectrum customer data, they can't implement customer experience programming with confidence.

Ensuring that every customer touchpoint can both collect preferences and act upon stated preferences provides the customer with the desired engagement across the organization.

A BEST PRACTICE CHECKLIST

- Ensure your systems are designed to house and archive customer preference data
- Centralize your preference data
- Ensure your system is designed to easily set up new programs
- Develop an Application Programming Interface (API) toolset to share data across the organization
- Develop configurable reports so that you can see trends
- Develop a validation and alert process to ensure that processes are run correctly
- Ensure that your preference architecture is configurable

- Develop robust user management and security
- Develop a dynamic compliance rules engine
- Ensure that you have a defensible position if a regulatory compliance mistake is made
- Take a phased approach – start with a pilot such as a business unit or brand, or a customer segment that has a high potential of success
- Set success metrics – it’s important that you set measurable goals so you know how to reach them and when they’ve been met
- Report your results to management team – demonstrating a successfully deployed solution, along with favorable results, can help build enthusiasm for the next phase and make it easier because of the experience you’ve gained

Preference data is unique in that it’s one of the few pieces of data provided directly by the consumer. It can be used as lens to unlock and better use data that has been collected by other systems and via other means.

Organizations should build their preference management solution with the goal of how they want to report and use the preference data after they collect it centrally and share it across the enterprise. A unified view of preferences across the organization allows it to interpret preferences correctly, honor preferences consistently and reduce risk by maintaining compliance.

Field agents, call center reps or checkout clerks that have preferences available to them via system lookup capabilities can quickly look up preferences before contacting a customer, which ensures that they honor existing preferences. They call also ask for additional preferences or changes to existing preferences and update the system in real time.

GAINING EXECUTIVE BUY-IN

Because Enterprise Preference Management affects each department or business unit differently, organizations must educate all of the stakeholders, including marketing, IT, legal and customer service, so that they understand the importance of this initiative and the benefits it will offer. Speak directly to the objectives and concerns of each department. For example:

- Marketing wants to improve campaign results and CLV
- Customer Service wants to improve satisfaction scores and cut support costs
- Legal wants to be in compliance in order to minimize risk
- IT wants to be on time and on budget.

CONSUMER CHOICE

According to Forrester Research, more than three-quarters (77%) of consumers say companies should let them decide how they can be contacted³. By offering opt-in marketing, IBM showed an 80% increase in sales, a 75% decrease in marketing waste, and a 6-point increase in customer satisfaction.⁴

The average conversion rate for opt-in marketing and advertising stands at 25.15%: considerably higher than the rate for mobile display ads (in the low single digits), more than twenty times the response rate for direct marketing (1.38%) and also much higher than web advertising (where a response rate of 0.08% is considered a successful campaign response rate).

According to a study by MyBuys, an e-tailing group, 40% of respondents stated that they buy more from retailers that personalize their shopping experience across channels. Additionally:

3 - Source: Forrester Research: Marketers: Stop the Abuse! Adopt Preference Management. July 22, 2009

4 - *Opting In*, The Magazine of Direct Marketing Management, By Ernan Roman and Scott Hornstein

- 41% buy more from retailers that send them personalized emails
- 39% buy more from retailers that personalize Web recommendations.

The study noted that the practice of tailoring offers and promotions to consumers based on their past shopping or browsing experiences appears to increase buyer readiness, engagement and sales activity. These findings are reinforced by sales data from MyBuys' own database of some 250 million shoppers: Customer-centric marketing delivers a 25% increase in total online sales and a 300% improvement in customer lifetime value, according to the company.

COST CONSIDERATIONS

Third-party software solutions typically have implementation and ongoing monthly fees based on preference volumes. You should compare the cost of outsourcing with the cost of building an in-house solution.

If you build an in-house solution, keep in mind that Enterprise Preference Management isn't a one-time project; it's an ongoing activity. You must ask yourself if you have the internal resources to build and maintain an EPM solution. Initial development can take two to three years and may cost millions of dollars. Ongoing tasks include collecting, managing and sharing the preferences among departments and business units, and maintaining compliance with relevant state and federal consumer privacy legislation.

The number and range of disciplines involved in defining, building and maintaining an EPM solution include, but are not limited to, the following positions:

- Marketing Management
- Business Operations
- Project Managers
- Technical Operations
- Systems Architects & Developers
- Business Analysts
- Quality Assurance

BUILD IT FOR THE CUSTOMER

Providing access to preferences at every consumer touchpoint with a brand is critical. For example, consumers should have easy access to their preference on the website, in emails, on mobile devices and when they interact with staff in call centers. Additionally, interfaces should limit the choices they have to make - providing the ability to opt-out of a specific communication that isn't of interest to the consumer is an elegant and simple way to allow self-management, or to opt-in to specific topics of interest and preferred communications channels.

Providing visual clues and examples with the preference management center assures consumers understand the choice they're making when presented with a larger list of options or potential channels.

Ultimately, the organization needs to build the EPM solution from the perspective of the user - not the internal organization - to ensure it's both intuitive and simple to use. Remember to respect opt-outs and ensure they're processed across specific channels, or all channels, depending on the user's preference. Let consumers determine when, how often, through what channels and what they want to receive from you, and make sure that analysts and marketers have all of the preference data for customers available in one up-to-date place.
